Spatial Temporal Analysis of Nightlights  
as Surrogate to Trends in Power Delivery  
(Presented by Shams Azad)

A satellite view of Puerto Rico at night, showing the island's outline and internal patterns of light. The lights represent power usage, with some areas appearing darker, indicating power loss or recovery patterns after Hurricane Maria.

# Night Lights After Hurricane Maria: Patterns of Power Loss and Recovery on the Island of Puerto Rico

# Recovery: months spent to reach 80% of capacity

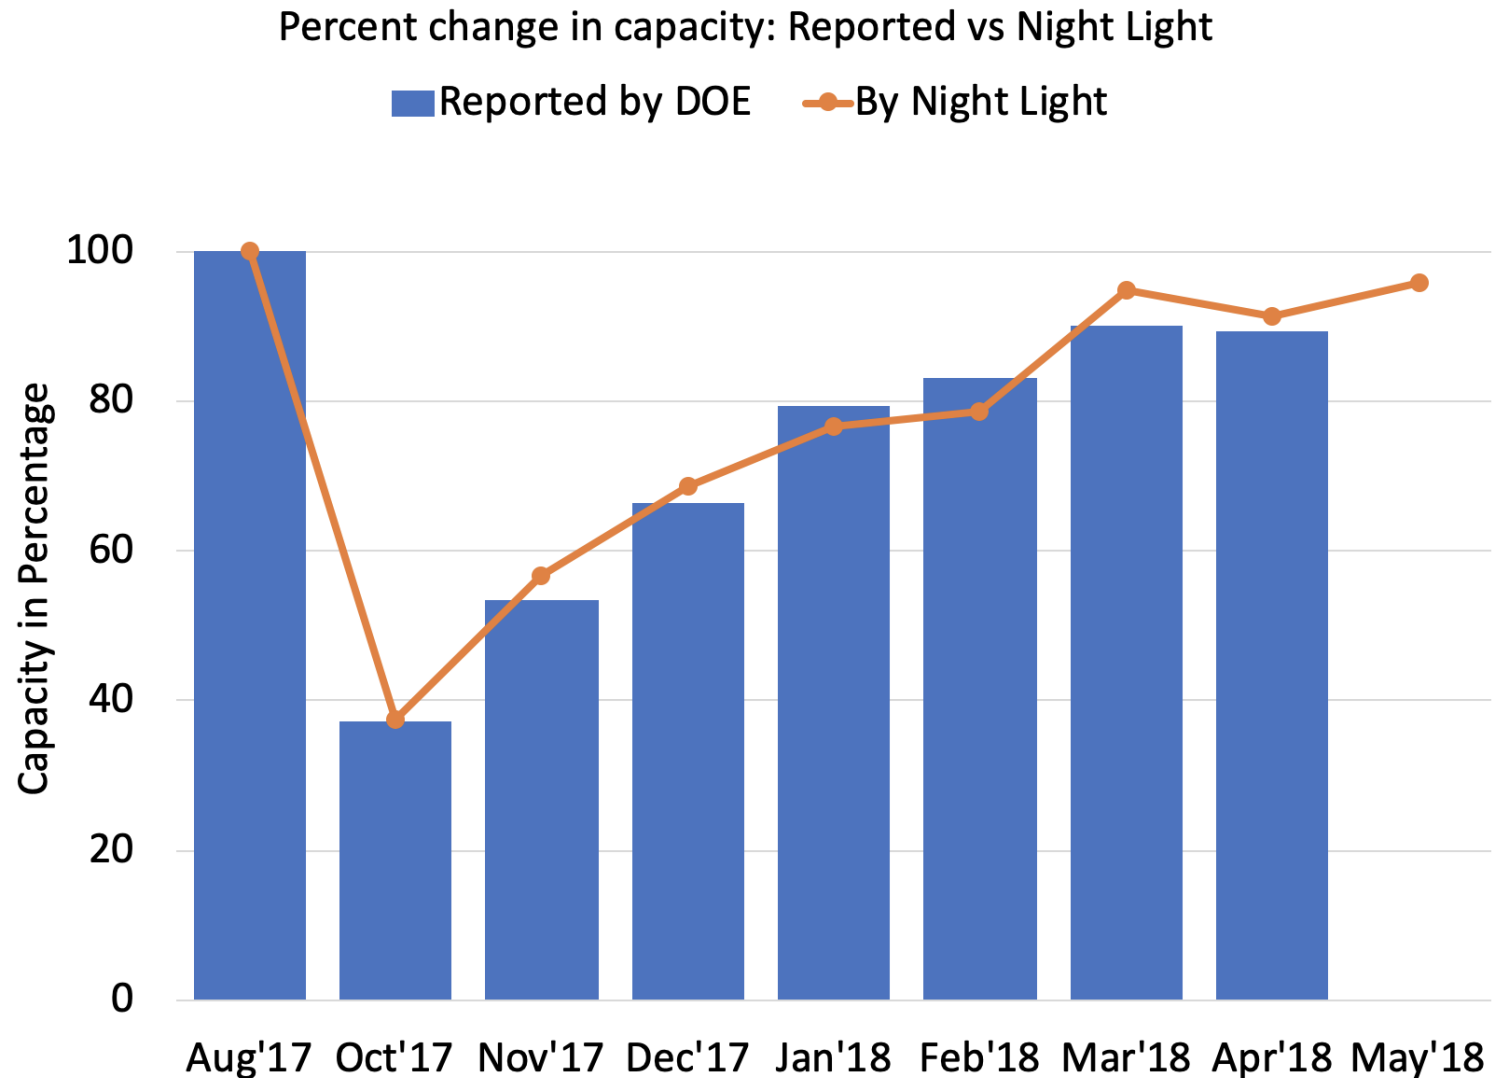

# Resilience for major municipalities

# Comparison of Night Light data (mean of 500m X 500m) with aggregated (island wide) power capacity reported by PREPA

500 meter resolution data  
This gives us the opportunity to carryout spatial and temporal analysis of population impact

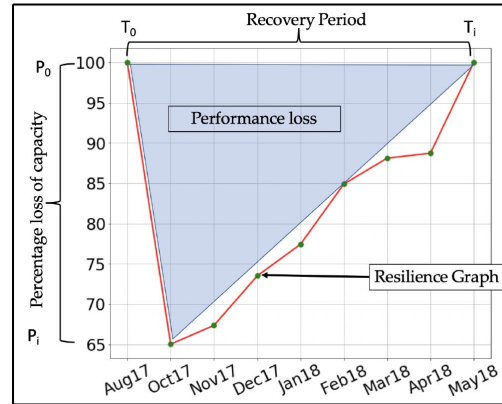

# Impact on people

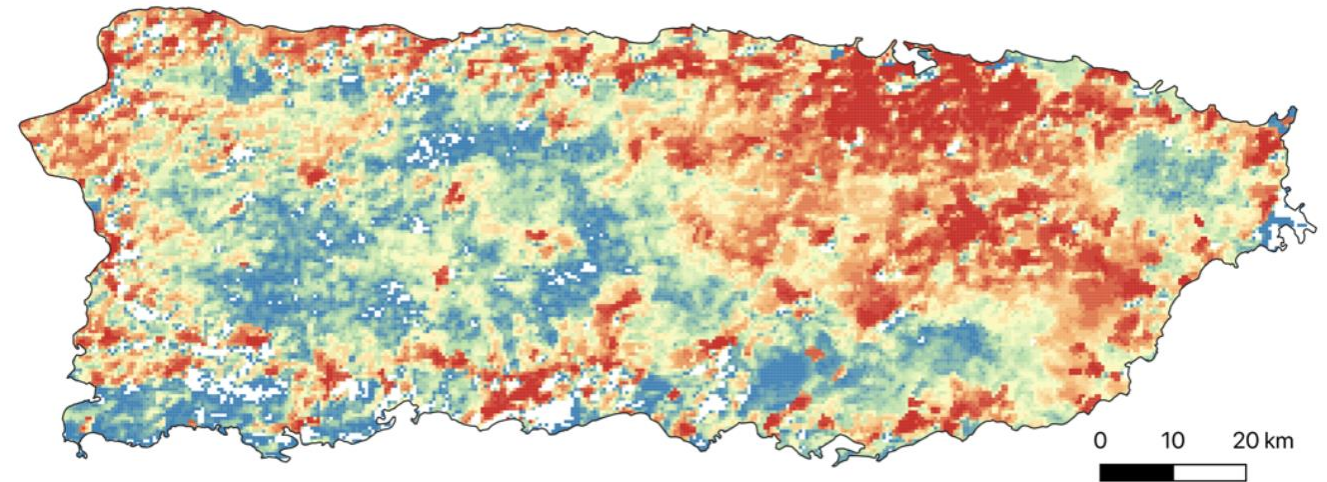

people-days without power =

Total people day without power for Hurricane Maria  
**270 million (people days).**

For island with 3 million population this is equivalent to **3 months** without power for the entire island

**X** Number of people  
 (Obtained from census block group)
